Relational Database Management System - Sybase | SAP

Database server is very important to isolate the data tier from the application tier and this will give better performance when querying your database specially for tera size databases. It is also important in disaster recovery situations as separate database server is more easy to recover than having a server that hosts both the applications and databases.

A Database Management System is a program used to store, delete, update, and retrieve data in a database. These databases can be limited to a single desktop computer, or can be stored in large server machines too, like the IBM Mainframe. Databases are warehouses of information, where large amounts of interrelated data can be stored.
