Evolution. In his theory of natural selection, which is discussed in greater detail later, Charles Darwin suggested that " survival of the fittest" was the basis for organic evolution (the change of living things with time). Evolution itself is a biological phenomenon common to all living things, even though it has led to their differences.

Theory of Evolution. In his book The Origin of Species, Darwin presented evidence for his "descent with modification" theory, which has come down to us as the theory of evolution, although Darwin avoided the term "evolution.". Essentially, Darwin suggested that random variations take place in living things and that the environment selects those individuals better able to survive and reproduce.

One piece of evidence offered by Darwin is found in the science of paleontology. Paleontology deals with locating, cataloging, and interpreting the life forms that existed in past millennia. It is the study of fossils—the bones, shells, teeth, and other remains of organisms, or evidence of ancient organisms, that have survived over eons of time. Paleontology supports the theory of evolution because it shows a descent of modern organisms from common ancestors.
