Genetic engineering is the process of using recombinant DNA (rDNA) technology to alter the genetic makeup of an organism. Traditionally, humans have manipulated genomes indirectly by controlling breeding and selecting offspring with desired traits. Genetic engineering involves the direct manipulation of one or more genes.

The main genetic engineering techniques used today are: recombinant DNA technology (also called genetic engineering), in which pieces of genes from an organism are inserted into the genetic material of another organism to produce recombinant organisms; nucleus transplantation technology, popularly known as "cloning", in which the nucleus of a cell is grafted into an enucleated egg cell of the same species to create a genetic copy of the donor (of the nucleus) individual; and DNA ...

Genetic engineering is changing the genetic material of an organism by removing, changing or inserting individual genes from another organism; The organism receiving the genetic material is said to be 'genetically modified', or is described as a 'transgenic organism'; The DNA of the organism that now contains DNA from another organism as well is known as 'recombinant DNA'

Genetic Engineering | CIE IGCSE Biology Revision Notes

Genetic engineering, also called genetic modification or genetic manipulation, is the direct manipulation of an organism's genes using biotechnology. It is a set of technologies used to change the genetic makeup of cells, including the transfer of genes within and across species boundaries to produce improved or novel organisms. New DNA is obtained by either isolating and copying the genetic ...

Genetic engineering - Wikipedia

The term genetic engineering initially referred to various techniques used for the modification or manipulation of organisms through the processes of heredity and reproduction. As such, the term embraced both artificial selection and all the interventions of biomedical techniques, among them artificial insemination, in vitro fertilization (e.g., "test-tube" babies), cloning, and gene ...

A genetic test is usually done using a sample of your blood or saliva. If you've been referred for a genetic test because you have cancer, the test will be done on a sample of the tumour that has already been removed as part of your treatment. The sample of blood, saliva or body tissue is sent to a genetic testing laboratory to be analysed.
