Better known for audio books, Myanonamouse has a larger and friendly community with some strict rules.

**Java Manual Serialization**  
Serialization and Deserialization in Java. Serialization in Java is a mechanism of writing the state of an object into a byte-stream. It is mainly used in Hibernate, RMI, JPA, EJB and JMS technologies. The reverse operation of serialization is called deserialization where byte-stream is converted into an object.

**Serialization In Java - javatpoint**  
Java - Serialization. Java provides a mechanism, called object serialization where an object can be represented as a sequence of bytes that includes the object's data as well as information about the object's type and the types of data stored in the object. After a serialized object has been written into a file, it can be read from the file and ...

Since you don't want (for some reason) to use Java serialization, you can use XML serialization. The simplest way is via XStream: XStream is a simple library to serialize objects to XML and back again. If you are really sure you don't want to use any serialization framework, you can of course use reflection. Important points there are:

1. Java Custom Serialization. In most of cases, when you will customize Java serialization, you will be writing the fields one by one - in a sequence. Its most common way to override default Java serialization process. Let's say, we have one User object and we want to customize it's serialization process.
