Description: Sedimentary Environments is one of the most distinguished and influential textbooks in the earth sciences published in the last 20 years. The first and second editions both won universal praise and became classic works in sedimentology. Since the publication of the last edition, the study of sedimentary environments and facies has made great strides, with major advances in facies modelling, sequence stratigraphy and basin modelling.

In geology, depositional environment or sedimentary environment describes the combination of physical, chemical and biological processes associated with the deposition of a particular type of sediment and, therefore, the rock types that will be formed after lithification, if the sediment is preserved in the rock record. In most cases the environments associated with particular rock types or associations of rock types can be matched to existing analogues. However, the further back in geological t

Our work is focused on understanding the physical, chemical, and biological controls on the characteristics and distribution of sedimentary facies. We are particularly interested in studying modern siliciclastic depositional environments to use them as analogues for understanding Earth's surface processes and deposits from the geological past.

The most proximal(close to sediment source) and coarse grainedof water-transported sedimentary environments is the alluvial fan. These cone shaped depositsform where high gradient narrow canyon streams discharge onto flat plains at the mouths of canyons. At this point, streams typically lose the competenceto transport framework clasts.

Deltaic depositional faciesresult from interacting dynamics processes (wave energy, tidal regime, currents, climate, etc.), which modify and disperse riverborne (fluvial) clastic deposits. The term delta was first applied by the Greek philosopher Herodotus (490 B.C.) to the triangular land surface formed by deposits from Nile River distributaries.

Facies are the external appearance or look of general use, it is really a distinctive rock unit that forms under certain conditions of sedimentation, reflecting a particular process or environment. There are three different rock facies which are sedimentary facies, metamorphic facies, and seismic facies.
