The cobalt and nickel derivatives of L1 have been found to catalyse the hydroxylation of both cyclohexane and adamantane in the presence of m-CPBA as an oxidant with good selectivity and TON values. In particular, the cobalt derivative 1 is the catalyst with the highest TONs reached, while the nickel complex 2 is the most selective catalyst for ...

The aims of this study were to synthesize and characterize a nickel cobalt sulfide (NiCo 2 S 4), namely a ternary transition metal sulfide, by the solvothermal method for DSSC applications. Four samples of NiCo 2 S 4 nanoparticles (NCS1, NCS2, NCS3 and NCS4) were synthesized by varying the amount of thiourea used in the synthesis. The samples were found to have an average crystallite size of 3 nm.

As the reaction progressed, [NiF x–n (OH) n] (x–2)– was slowly hydrolyzed to [Ni (OH) x] (x–2)–, forming an α/β -Ni (OH) 2 mixed structure. During this time, the added Co 3+ ions were inserted into the crystal lattice. The trivalent cobalt ion displaced nickel ions in the nickel hydroxide laminates.
