When it comes to sensory processing regulation, the vestibular system is a critical sixth sense that doesn't always get the attention it deserves. If you're reading this blog as a landscape architect or playground designer, we hope you'll consider Goric's dynamic swings and spinners, as well as and playground options, for engaging this important area of neurologic regulation and development.

We all know about our five senses: sight, smell, taste, sound, and touch. But did you know that all humans have a sixth sense? It's our vestibular system!

Your Child's Sixth Sense: The Vestibular System ...

The Sixth and Seven Senses: The Vestibular and Proprioceptive Systems. You probably first heard of the five senses in kindergarten. You played games and practiced lessons that helped you learn about sight, smell, sound, taste, and touch. However, there are two more senses that don't typically get mentioned in school — the sixth and seventh senses – that are called the vestibular and proprioceptive systems.

Where is the vestibular system? The vestibular system is comprised of several structures and tracts, but the main components of the system are found in the inner ear in a system of interconnected compartments called the vestibular labyrinth. The vestibular labyrinth is made up of the semicircular canals and the otolith organs (all discussed below), and contains receptors for vestibular sensations.

The Vestibular System: A Sixth Sense by Jay M. Goldberg ...

The vestibular system, in vertebrates, is part of the inner ear. In most mammals, it is the sensory system that provides the leading contribution to the sense of balance and spatial orientation for the purpose of coordinating movement with balance. Together with the cochlea, a part of the auditory system, it constitutes the labyrinth of the inner ear in most mammals. As movements consist of rotations and translations, the vestibular system comprises two components: the semicircular canals, which

Vestibular system - Wikipedia

On a more complicated level, the vestibular system generates complex information about where your body is in space. This sixth sense coordinates movements in combination with balance. It is responsible for keeping you upright and it creates rapid reflexes based on the stimulus received from the environment.

What is the Vestibular System? Does My Child Have a ...

The human vestibular system estimates body position and motion. Motion inputs to the vestibular system include the inner ear signals (“vestibular” in Fig. 1.1), as well as position sensation, (“proprioception”) visual signals, and intended movement (“motor commands”). These redundant inputs are integrated by the central processor, the “vestibular nuclear complex,” which ...

The vestibular labyrinth in all vertebrate classes receives an efferent innervation, arising from cells in the brain stem. 2 reviewed the peripheral innervation patterns and central pathways of the efferent vestibular system (EVS) in mammals while synaptic mechanisms were considered in Chapter 3. This chapter emphasizes possible functions of the efferent innervation.

Efferent Vestibular System - Oxford Scholarship

The complexity of the human balance system creates challenges in diagnosing and treating the underlying cause of imbalance. The crucial integration of information obtained through the vestibular, visual, and proprioceptive systems means that disorders affecting an individual system can markedly disrupt a person's normal sense of balance.

The sixth sense - Brief introduction to the vestibular ...

Often referred to as the 'sixth sense', our vestibular system is located in our inner ears and is responsible for our spatial awareness. It allows us to coordinate balance with movement and, when performing correctly, it works in conjunction with our other senses to ensure we feel safe in our environment.
