this kind of turbulent dynamics, it might be useful to introduce plasma turbulence by stressing the similarities and differences with respect to uid turbulence. First, turbulence in magnetized plasmas is quasi-two-dimensional. The strong background magnetic field leads to a strong anisotropy in the plasma particles' motion. While they are able to move

Turbulent low frequency electrostatic fluctuations are identified as one of the most effective transport mechanisms of plasmas across magnetic field lines. These phenomena are studied by laboratory experiments in magnetized toroidal plasmas (in part by use of existing data from the Blaumann experiment), and also by analytical methods.
